

Executive Summary for Executive and Government Stakeholders

Customer, Product and Profitability Performance Analysis in Supply Chain Operations

APL Logistics (KWE Group)

Author: MD ANWAARULLAH KHAN

Prepared For: Unified Mentor and Executive/Government Stakeholders

Revenue \$36.78M	Profit \$3.97M	Margin 10.78%	Transactions 180,519
-----------------------------------	---------------------------------	--------------------------------	---------------------------------------

This executive summary explains the business value of the dashboard and highlights the most important findings for decision makers. The analysis confirms that APL Logistics should evaluate customers, products, and markets using profit contribution, not revenue alone.

1. Project Purpose

The purpose of this project is to identify where APL Logistics creates profit and where profit is being weakened by discounts, low-margin categories, and uneven regional performance. The dashboard was created to help managers move from revenue-focused reporting to profit-aware decision making.

Executive dashboard snapshot showing the overall revenue, profit, margin, order volume, and customer segment contribution.

2. Most Important Findings

Finding	Result	Why it matters
Overall performance	\$36.78M revenue, \$3.97M profit, 10.78% margin	The company is profitable, but margins require active control.
Customer contribution	Consumer segment contributes about 51.9% of revenue	Customer strategy should focus on profit tiers, not volume alone.
Category performance	Golf Bags & Carts has the best margin; Strength Training is weakest	Pricing and freight cost review should begin with weak categories.
Discount scenario	15% cap raises projected profit to \$4.40M	Discount governance can directly improve margin.
Market performance	USCA has the strongest market margin	Regional growth should be evaluated through margin as well as sales.

3. Commercial Interpretation

The results show that some areas of the business are creating strong value while others are reducing the final profit pool. The Pareto pattern is especially important: profitable customers create more value than the final net profit because weaker accounts and loss-making orders pull the total down. This means that customer retention and pricing should be guided by customer profitability.

Customer profit concentration view showing the importance of value-tier management.

Product analysis also shows that not all product categories should be treated the same. Golf Bags & Carts has the strongest margin, while Strength Training has very weak profitability. This suggests that category-level pricing and cost review would be more effective than applying the same commercial approach to every product group.

Product and category performance view highlighting high-profit products and category margin differences.

4. Discount and Regional Action Points

Discounting is a major area for improvement. The 15% cap simulation indicates a projected profit increase of about \$429K, moving profit from \$3.97M to \$4.40M and raising projected margin to 11.95%. This supports a practical recommendation: discounts above 15% should be reviewed and approved instead of being applied automatically.

Discount impact view showing margin risk and projected profit improvement under the 15% discount cap scenario.

The market and regional views show that commercial performance differs by geography. USCA has the strongest market margin, while Western Europe and Central America are the highest profit regions. These insights can help managers decide where to expand, where to review operating costs, and where to adjust pricing.

5. Recommended Next Steps

1. Set a discount approval rule for discounts above 15%.

2. Use customer profit tiers for account management and retention planning.
3. Review Strength Training and other weak-margin categories for pricing, freight cost, and discount issues.
4. Track market and regional profitability monthly, not only sales.
5. Continue using the Streamlit dashboard as a decision-support tool for commercial reviews.

Overall, the project shows that better profitability visibility can help APL Logistics protect margin while still supporting growth.
